

BIOSECURITY MEASURES IN BEEKEEPING | VARROOSIS

Using Low-Impact Compounds Properly

Use of Thymol

Once the infestation level of varroa is high, all the hives in the apiary should be treated following the national legislation and product label.

The temperature and the brood quantity should always be taken into consideration.

step 1

Find out which substances can be legally used in your country. This picture, for example, is from a guide from Slovakia, loosely translated as 'Methods for treatment of bees over the year'.

step 2

Obtain the chemicals from a certified shop.

step 3

Adjust the size of the treatment according to manufacturer's instructions to the right size for your beehive.

step 4

Place the product containing thymol inside the beehive.

step 5

Use a sheet of paper to measure the number of fallen mites on the bottom of the hive.
